OptiFill™

OptiFill is our flagship prescription processing workflow solution — delivering accuracy and efficiency while virtually eliminating the potential for costly fulfillment errors in critical specialty operations.

At ARxIUM, we know that specialty pharmacies are focused on high-touch, high-cost medications required to treat patients with complex and/or chronic disease states. We also know that many of these medications have unique storage, processing and handling requirements, making them even more costly than standard formulary items. All of this results in significant financial impacts and, more importantly, potentially serious ramifications for patients should any prescription processing errors occur.

Prescription Processing Systems (PPS)
The PPS software suite combines highly configurable workflow software with optional automation and conveyors, and includes multiple levels of barcode validation to ensure that each specialty patient receives an accurate and complete medication order that was dispensed, inspected and packaged for shipment according to the proper handling protocols. Superior safety, performance, and configuration have driven leading specialty pharmacy providers to select OptiFill as the solution of choice for their fulfillment operations.

Guided Workflow with Barcode Validation
Multiple levels of checks and balances are built into the OptiFill fulfillment process, virtually eliminating the potential for human error at any step. Any key fulfillment step involving a human action can be linked to a successfully barcode scan.

Specialized Handling Requirements Flags
The PPS software can receive messages via the host system interface that designates special requirements, like cold packs. PPS can even require scanning a barcode on cold packs to validate that it is included with the shipment.
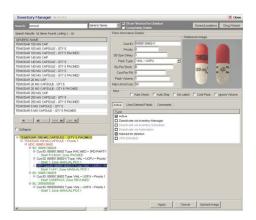

Paperwork Management
PPS can facilitate the paperwork for order printing, including FDA MedGuides, patient instruction guides, etc. Barcodes can be printed on paperwork packets to validate that they were printed and included in the patient's order.

Data Tracking and Reporting
Lot and expiration data for all formulary items can be tracked and reported through the system.

Shipping Interfaces
PPS can facilitate information exchange with manifest and shipping programs, including those used by the most common carriers.

ARxIUM
Innovative Pharmacy Solutions

We are confident that OptiFill will give you the tools you need to be assured your specialty pharmacy operation is running smoothly and efficiently. We're also confident that OptiFill will enable you to focus more on meeting the ever increasing demand for improved patient care and less on where your next processing error will occur.

BENEFITS IN THREE KEY FUNCTIONAL AREAS:

General Design	Proprietary Software	Dispensing Technologies
Our OptiFill solution is highly configurable, scalable and not restricted by a single technology or device. This enables us to better optimize system designs for each customer's unique needs and ROI requirements.	PPS is the "brain" that drives all OptiFill systems and it has proven to be extremely reliable in virtually every segment of the pharmacy market. In line with the broader solution, PPS is a flexible platform which can drive operations from 500 to more than 50,000 prescriptions per shift. It's also highly configurable and can be integrated easily with multiple enabling technologies, whether they are ARxIUM-provided or not.	OptiFill systems are designed to be modular, enhancing flexibility and system scalability for more efficient operations. This allows us to more easily upgrade equipment when necessary and seamlessly incorporate new technologies for better long-term return on investment.
